Wound - minor bleeding

Symptoms

- + Small and superficial wound, where the depth is easy to determine e.g. where the wound can be moved by moving the surrounding skin
- + Wound that does not bleed or bleeds only slightly, but may be of considerable depth and penetrate vital structures of joints, tendons, ligaments, etc.
- + Surrounding area of the wound is not swollen, reddened, hot or showing signs of pain when touching it
- + No lameness or fever (Indicates that important structures are still intact)
- + No foreign objects in the wound

Wound - minor bleeding

Measures

- + Observe the wound- wear gloves to avoid possible contamination
- + Call the vet if the wound is deeper than just the surface of the skin (wound doesn't move while moving the surrounding skin)
- + Do not apply any medication without the vets consent
- + Superficial wound (moves with surrounding skin): Let the natural healing process take its course without too much intervention. Keep it clean and observe it daily. (Wear gloves, avoid contamination)
